

n8n

Claude API

Gmail API

Google Sheets

Notion API

Power BI

1. Project Overview

What it does: An agentic AI system that reads sales leads from Google Sheets, uses Claude AI to write a unique personalised email for each person, sends it via Gmail automatically, reads replies, classifies them with AI, triggers follow-up sequences — and logs everything into Notion and Power BI.

Why it matters: 100% of manual email writing is eliminated. The agent runs daily at 9 AM without any human input, handles 50+ leads per day, and feeds reply outcomes back into the loop for automated follow-up.

Status: Fully built and working. Workflow tested end-to-end with live Gmail and Claude API integration.

2. Tech Stack

Tool	Role	Why used
n8n	Workflow engine	Orchestrates all nodes — triggers, API calls, routing, looping
Claude API	AI brain	Writes personalised emails + classifies replies with context
Gmail API	Email delivery	Sends emails and reads reply inbox automatically via OAuth2
Google Sheets	Lead database	Stores Name, Company, Role, Email, Status for each lead
Notion API	CRM logging	Logs sent emails, reply type, follow-up status
Power BI	Analytics	Live dashboard: send volume, reply rate, conversion KPIs

3. How The Agent Works — Step by Step

Step 1	Read Leads	n8n Schedule Trigger fires at 9 AM. Google Sheets node reads all rows where Status = pending.
Step 2	Valid Lead Check	IF node checks email is not blank — skips bad rows silently so workflow never crashes.

Step 3	Write Email with Claude	HTTP Request node calls Claude API with a structured prompt containing Name, Role, Company. Claude returns Subject + Body.
Step 4	Parse Email	Code node splits Claude's response into Subject line and email Body using JavaScript.
Step 5	Send via Gmail	Gmail node sends the email to the lead. Reply-To is set to your address.
Step 6	Update Sheet	Google Sheets node marks Status = sent and saves the date + subject line.
Step 7	Read Reply (Gmail)	A second Gmail trigger watches the inbox for replies. When reply arrives, it feeds into next step.
Step 8	Classify Reply with Claude	Claude reads the reply and returns: Interested / Not Interested / Needs Follow-up.
Step 9	Route & Follow-up	n8n Switch node routes based on classification. Interested → CRM ping. Needs Follow-up → schedule follow-up email.
Step 10	Log to Notion + Power BI	Notion API creates a record. Power BI dataset refreshes to show updated KPIs.

4. Prompt Engineering (Claude)

Write a cold email to {{Name}}, who is {{Role}} at {{Company}}.

Rules:

- Max 5 sentences
- Open with a reference to their company
- Mention ONE specific pain point for their role
- End with a soft CTA: suggest a 15-minute call
- Tone: professional but human, not salesy
- Format: first line = 'Subject: [subject]', blank line, then body only

5. Resume Bullets — Copy & Paste

- Built an end-to-end agentic AI sales email system using N8N and Claude API that autonomously generates hyper-personalised outreach emails, eliminating 100% of manual email drafting effort

- Integrated Gmail API with N8N workflows to automate email dispatch and multi-step follow-up sequences, triggering contextual follow-ups based on recipient behaviour without manual intervention
- Implemented AI-powered reply summarisation using Claude API — automatically classifying responses as Interested / Not Interested / Needs Follow-up and feeding outcomes back into the workflow loop
- Built a Power BI dashboard tracking email performance KPIs (send volume, reply rate, follow-up conversion) enabling data-driven optimisation of outreach campaigns

ATS Keywords to include in Skills section:

N8N · Agentic AI · Claude API · OpenAI API · Prompt Engineering · Workflow Automation · Gmail API · LLM · CRM Automation · Power BI · REST API · Sales Automation

6. How to Upload to GitHub — Easy Steps

Step 1 — Create GitHub account

Go to github.com → click Sign up → use a professional username (e.g. yourname-dev). It's free.

Step 2 — Create new repository

Click + (top right) → New repository → Name: ai-sales-email-agent → set to Public → tick 'Add a README file' → click Create repository.

Step 3 — Upload your files

Inside the repo, click 'Add file' → 'Upload files' → drag and drop:

- README.md
- sales_email_agent.json (n8n workflow)
- AI_Sales_Email_Agent_Portfolio.pptx
- AI_Sales_Email_Agent_ProjectDoc.pdf
- leads_sample.csv

Click 'Commit changes'.

Step 4 — Add description & topics

On repo main page: click  gear icon next to 'About' → add description: 'Agentic AI sales email automation using n8n, Claude API and Gmail API' → add topics: ai, n8n, automation, llm, sales-automation → Save.

Step 5 — Pin repo to profile

Go to your GitHub profile page → click 'Customize your pins' → tick ai-sales-email-agent → Save. Now it appears first when recruiters visit your profile.

Step 6 — Add to your resume

Under Projects section on your CV:

AI Sales Email Agent | n8n · Claude API · Gmail API · Power BI

github.com/yourusername/ai-sales-email-agent

Step 7 — Add a screen recording (bonus)

Record a 60-second Loom video of n8n running the workflow. Add the Loom link to your README. This is the single biggest differentiator in portfolio projects.
